

Bon Bon Bakery Shop

Assignment 5, By: Aditi Magal

Reflection

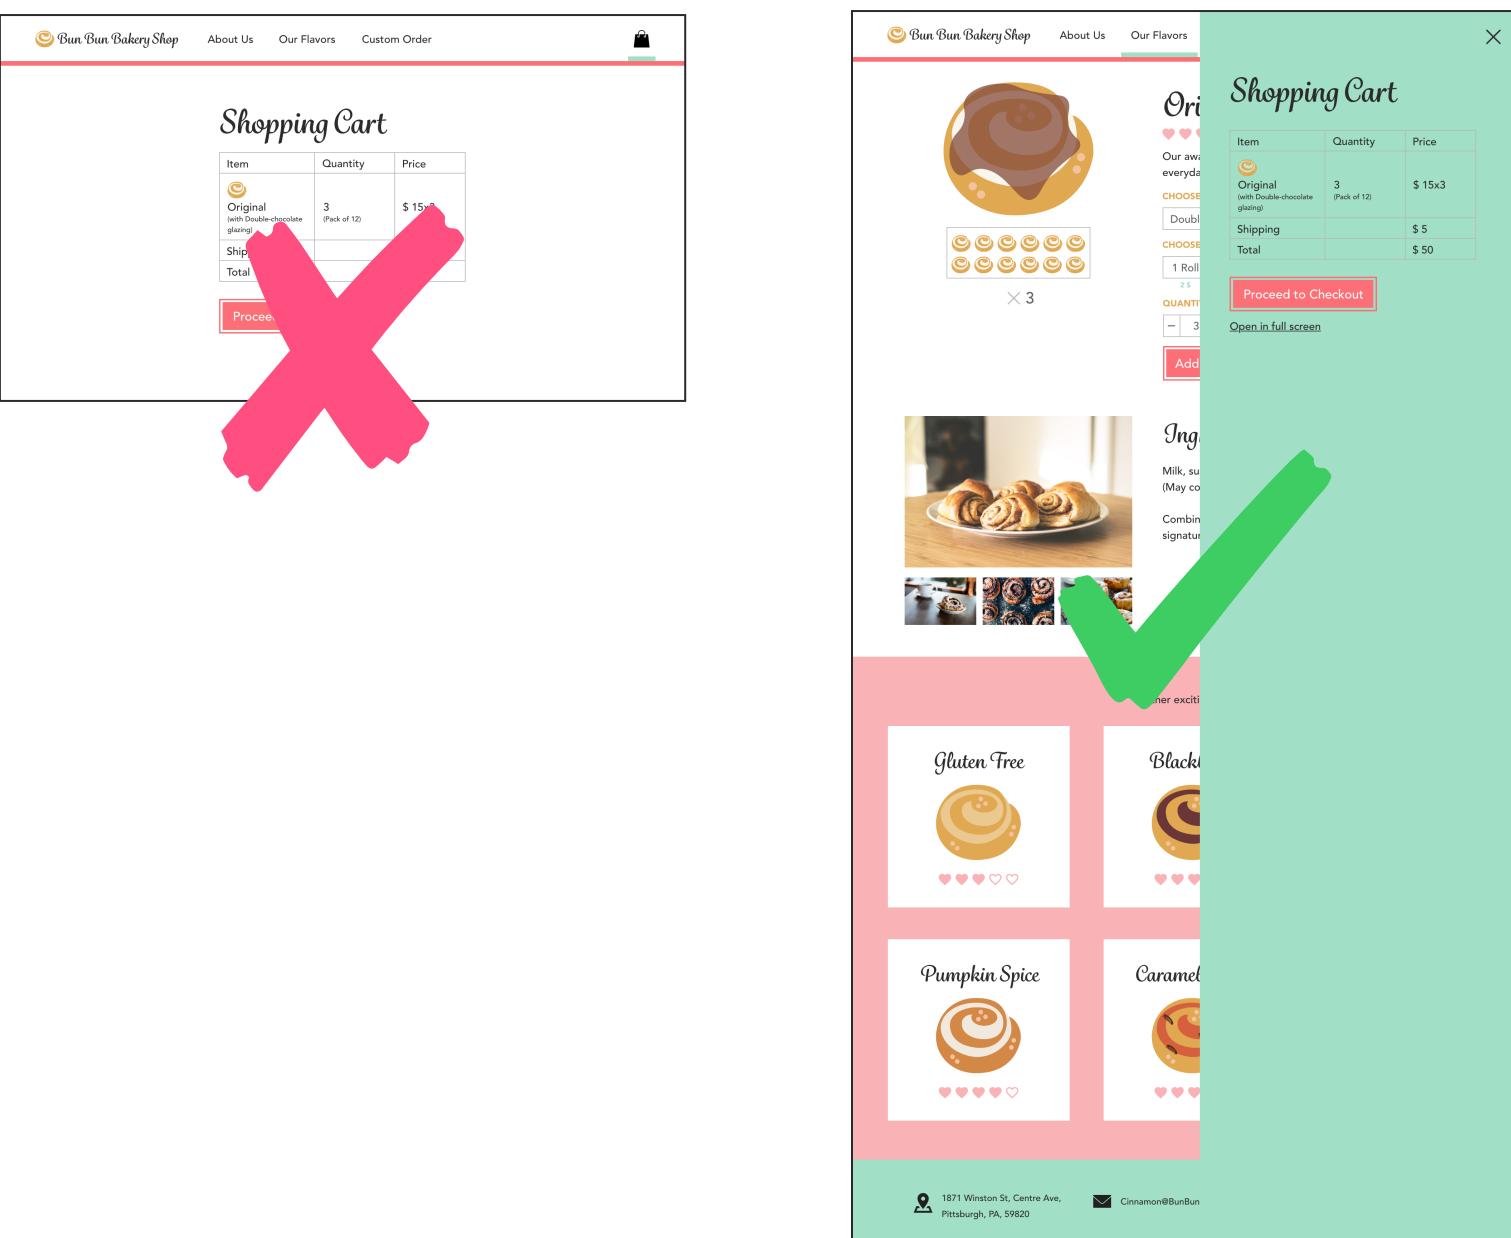

Since this is my first time coding a website, this assignment took me a lot of time. However, with patience, exploration and a lot of trial and error I created working HTML and CSS code for 4 pages- HomePage, Product Browsing Page, Product Detail Page, Shopping Cart and About Us.

Heuristic Evaluation + Fixes

Consistency and standards

My original design had two ways of getting to the shopping cart. It either opened up on the side or you could click the shopping cart button in certain circumstances to go to a full page view of the shopping cart. This seemed unnecessary as there were too many ways to get to the same page.

My fix: I removed the full screen shopping cart page and kept the right side cart page.

Heuristic Evaluation + Fixes

Visibility of system status

It is hard to tell which page the user is on since there is no obvious indication in the navigation bar.

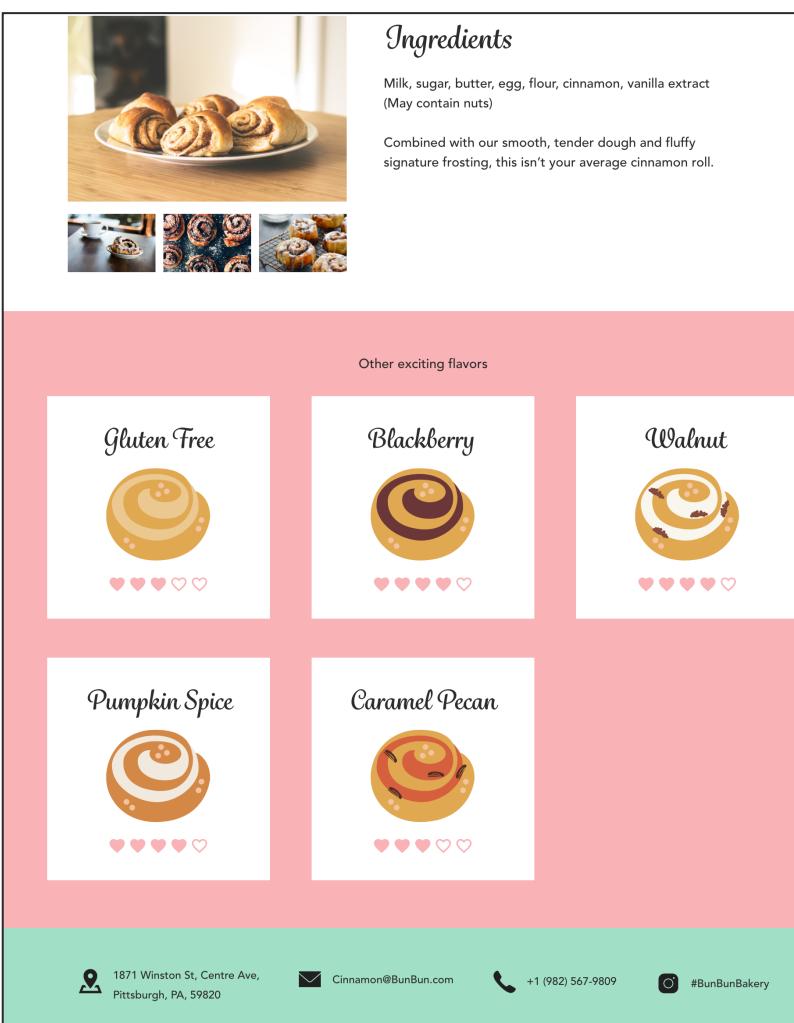

My fix: I added green bars for the active state of every page.

Flexibility and efficiency of use

Initially the product page did not have recommendations for other cinnamon buns. Users had to go back to the homepage for this.

My fix: Adding a recommendation section on the product page.

Challenges + Bugs

- Since this is my first time coding HTML and CSS I encountered many bugs and issues. When I design I want everything to be pixel perfect, but it was hard to get the same precision in coding the website.
- When I was designing on my 1450 pixel screen width everything looked really good and I was able to change some alignments in HTML. However, when I dragged the screen to another size (for example, mobile screen width) everything seemed to break. I guess I will have to learn how to do responsive design next.
- I did not know how to code the shopping cart page, how to make it hover in and match the number of items chose, but I think this might be a JavaScript problem.
- I also did not find the Grafolita font I was using on my prototype, so I had to use Google fonts for the cursive parts and remake some graphics.
- Simple things took a lot of time to fix. For example, finding how to add padding on the left side wasn't always enough. I would have to figure out exactly where to place it which took a lot more time.
- Overall this was a very tough exercise for me, taking a lot of time (unlike the assignment 3+4 which were easier since I am familiar with InVision and AdobeXD). I wish I had made my design simpler to code.

Brand Identity

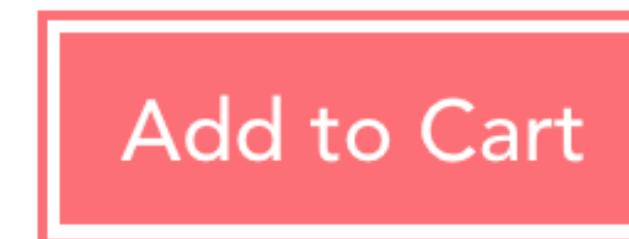

- I wanted to use warm and light colors to create a trendy vibe for my website. I wanted the website to look inviting and a way for my client to show off their experience.

- I designed my logo for Bun Bun Bakery using a cursive style which went well with my pastel bakery theme.

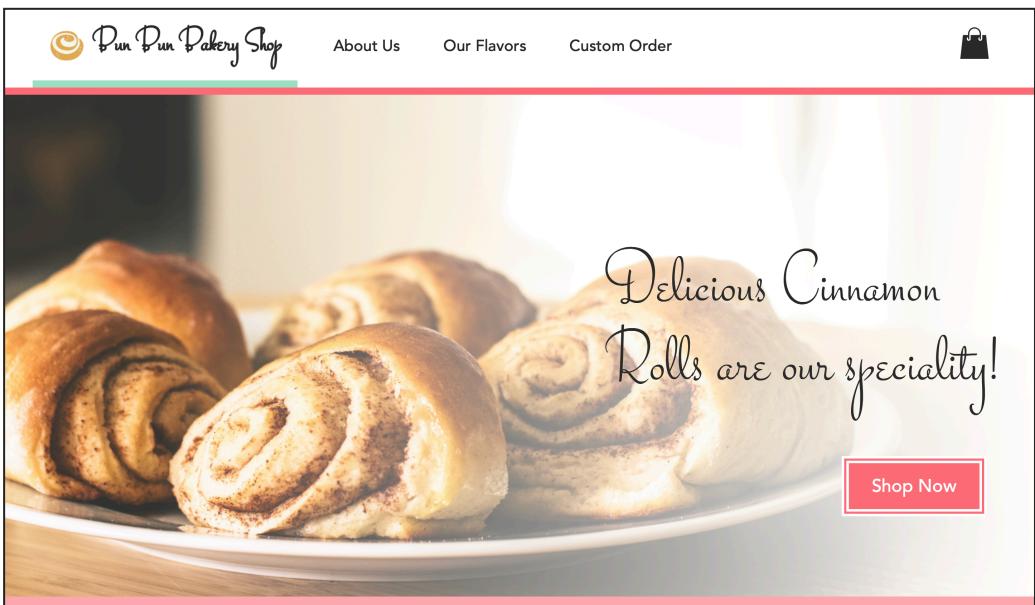

- All the content was carefully considered to be energetic and informal.
- I wanted to make the CTA's very obvious. I did this by making the buttons big and hover functionality very obvious.

- I modified existing icons so all my icons would fit a similar family and look consistent with my aesthetic.

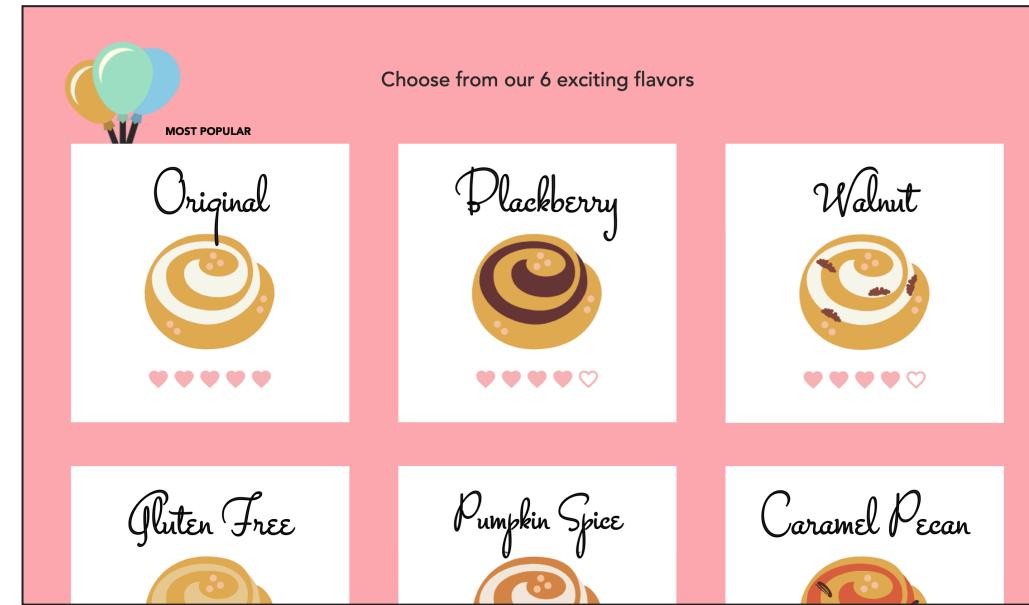

Website width: 1450 px

Home Page

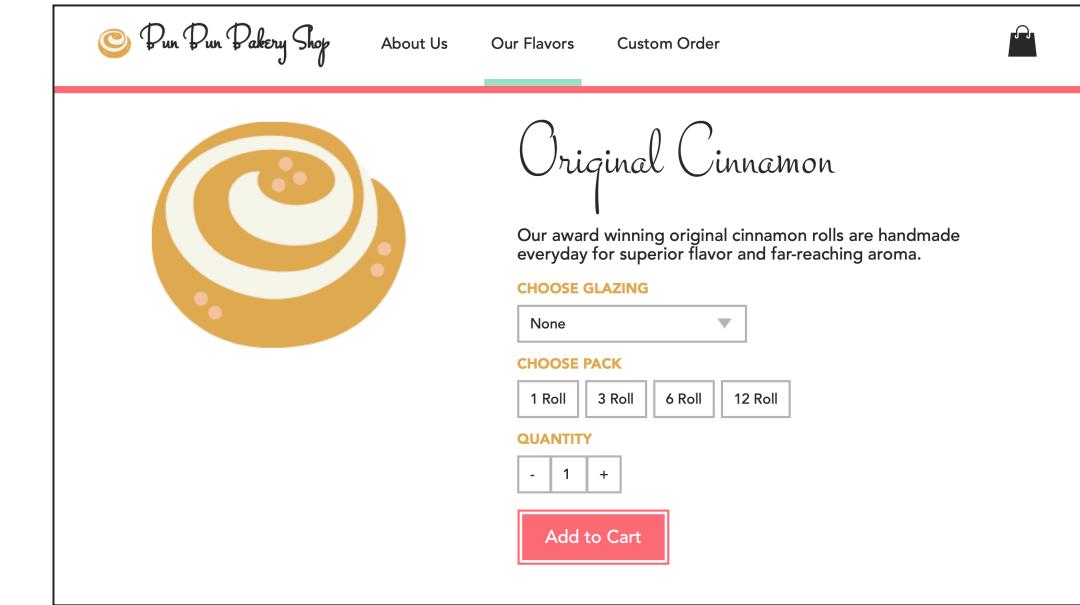

index.html

Product Browsing Page

index.html#Flavors1

Product Detail Page

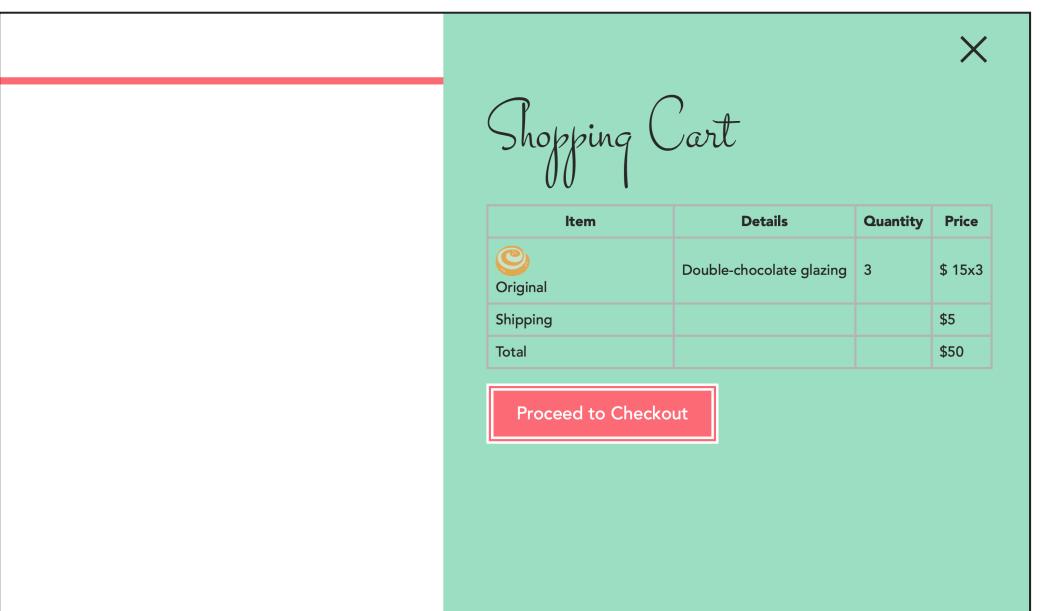

Original.html

Website width: 1450 px

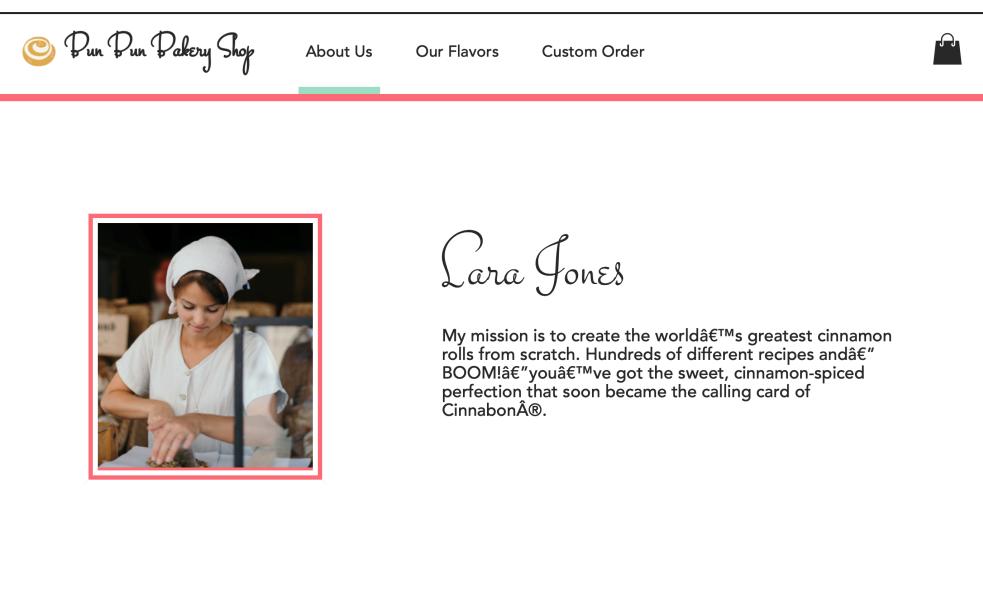

Shopping Cart

(since my Homepage and product browsing pages are the same)

ShoppingCart.html

About Us (Extra Page)

AboutUs.html
